

PREFACE

The Malawi Growth and Development Strategy (MGDS) was launched in July 2007 and shall run for five years. The MGDS is the overarching development strategy for the country. The Government of Malawi is fully cognisant of the need for quality statistics in policy formulation, decision making, targeting of resources and in the monitoring and evaluation of the MGDS and the Millennium Development Goals (MDGs). The Government, through the National Statistical Office, conducts a Population and Housing Census every 10 years in order to address the data requirements of these frameworks.

Malawi has regularly participated in the United Nations decennial census programs and the fifth and latest was the successful conduct of the Population and Housing Census by the National Statistical Office (NSO) in June 2008. As a primary source of socio-economic and demographic data, the Census provides the country with important information to foster national development, good governance and decentralization.

I would like to acknowledge the continued support received from development partners and individuals during post-enumeration period. Specifically, I wish to thank the United Nations Population Fund (UNFPA) for providing funding, technical assistance and coordinating all other development partners: the Department for International Development (DFID) of the British Government, the Irish Aid from the Irish Government, Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ) from the German Government, the European Commission (EC) and the African Development Bank (AfDB). My thanks also go to other government ministries and departments for their cooperation and support during the census process.

Finally, I would like to thank staff from the National Statistical Office for their professionalism and dedication in undertaking data analysis and preparation of this thematic report. This population projections report is among the many that will be prepared by the NSO.

Abbie Marambika Shawa, MP

Minister of Development Planning and Cooperation

FOREWORD

The report presents the projected absolute numbers and age-sex differentials of the population in Malawi until 2050 for the national level and until 2030 on a district level. Population projections are an essential input to development planning, the design of policies and economic and social initiatives.

The analytical results are based on data from the 2008 Population and Housing Census that was conducted from 8 – 28 June 2008 by the National Statistical Office. The enumeration was successfully conducted by large teams of enumerators and supervisors after undergoing rigorous training prior to the deployment. The planning and organizational structure put in place ensured high household coverage.

The projections were made using the Cohort Component Method, whereby three components responsible for population change, namely mortality, fertility and migration are projected separately. The software utilized was Rural-Urban Projections (RUP) developed by the US Bureau of the Census. For the projection results at national level, special age groups such as child-bearing women, school going ages and elderly are presented.

The population projections report is one of the many reports NSO has produced, including the Census Preliminary Report, released in November 2008 and the Main Census Report, released in November 2009. Others reports include: assessment of the sex and age structure; spatial distribution of the population (including urbanization); economic characteristics of the population; fertility and nuptiality; mortality; migration; household and living conditions; gender; children and youth; population with disability; elderly; and literacy and education. Other census products include: demographic atlas; district monographs and poverty maps.

I wish to acknowledge the dedication and professionalism of all the team members and others who spent many hours in analyzing data and preparing this report.

Charles Machinjili

Commissioner of Statistics

CHAPTER 1 ASSUMPTIONS AND METHODOLOGY

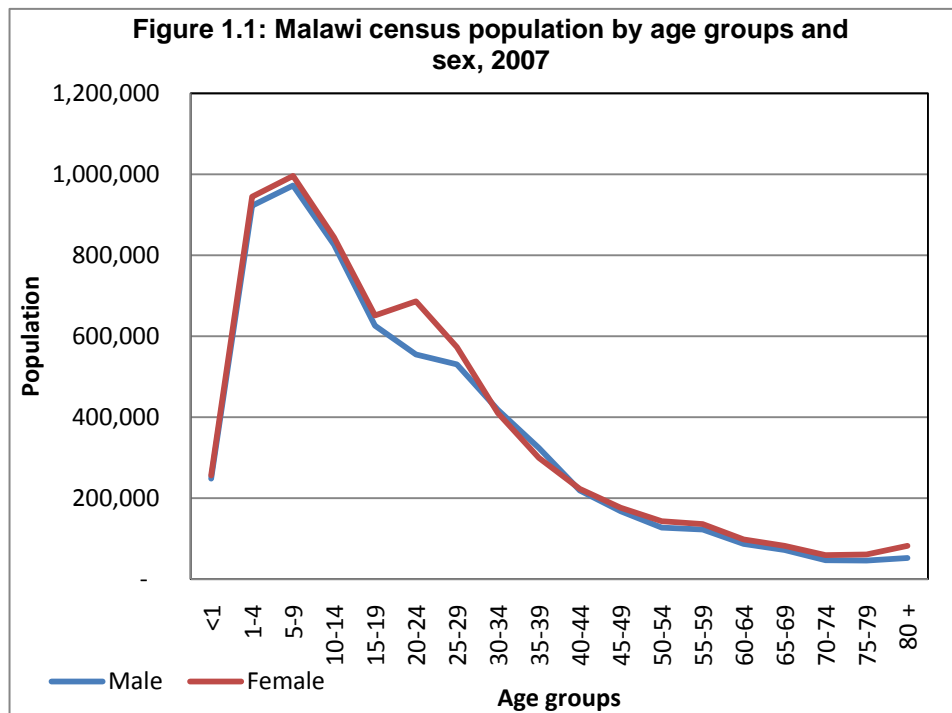

1.1 INTRODUCTION

Population projections are an essential input to development planning, the design of diverse public policies and many economic and social initiatives. This report contains population projections at national and district levels. The projections have been produced through the cohort component method. It involves calculating the future size of cohorts, taking into account the effects of the population components: mortality, fertility and migration. Its principle is to advance through time, in five-year increments, five-year cohorts from a base population. In its most basic form, the method provides population by sex and five-year age groups for the end of each quinquennium of the projection period. The software used to produce the projections is the Rural-Urban Projections (RUP) developed by the U.S. Bureau of the Census. One of the main advantages of this program is that it allows projections by single years. Data for special age groups that do not fall into conventional five-year age groups can be obtained with the feature. It also makes it possible to follow population cohorts that may be smaller or larger than adjacent cohorts due to past demographic events. In addition, the projection is executed year by year. By using the feature, it is possible to add information on demographic events for a particular year without the effect over a five-year period. It also provides users with estimates for each year without having to interpolate between data for intermediate years.

Input data for population and components can be provided in either single years or five-year age groups. The age grouping of each item is independent, so it is possible to input five-year data for some items and single-year data for others. The program converts all data sets to single years of age before executing the projection. This flexibility has the advantage of allowing a demographer to develop a projection model that accurately captures the demographic situation of a country and makes maximum use of available data in a way that is as close as possible to its original form. The program provides outputs on diverse demographic measures for any given year within the projection period such as population by age and sex (single years, 5-years age groups, and special age groups), summary measures, summary vital rates, life tables, migration rates, number of births and death.

For the national projections, the period covered is from 2008 to 2050 and for the district projections from 2008 to 2030.

1.2 BASE POPULATION

The base population used for population projections were obtained by smoothing the age distribution using a *strong* technique. An initial problem was age distribution of female population. **Figure 1.1** shows the problem (see also **Table 1.1**). Note the *bump* among women 20-24 years. The shape is somewhat abnormal for both males and females between ages 15-19 years and 25-29 years. The worksheet, ASMTX from the software PASEX was used¹ to smooth the data. The resulting population is presented in the second panel of **Table 1.1**. It is recognized that by using this method, some fluctuations in the age distribution may have disappeared.

80 +	134,019	52,040	81,979	134,019	52,040	81,979	134,274	52,139	82,135
						0-4	2,356,690	1,166,633	1,190,057

It is convenient to adjust the population 0-4 years, which is the age group more likely to be affected by under-enumeration. In the case of Malawi, however, the adjustment is not necessary, considering that the ratio between the 0-4 years and 5-9 years population is 1.20, suggesting little under-reporting in the age group. The ratio between the populations 5-9 years to 10-14 is 1.17. An attempt, was as made to adjust the above stated age distributions. It was performed by estimating the number of births that took place during the quinquennium previous to the census, which correspond to the population 0-4 years in the census date. According to these calculations, the under-enumeration of the age group would be almost 10%. If the population 0-4 is corrected by the percentage, the age ratio between 0-4 and 5-10 increases to 1.30, which is not correct considering the fertility and infant mortality levels in Malawi.

By convention, projections are prepared by the mid-year of the years covered by the projection period. Thus, in addition to smoothing the population, it was necessary to obtain the mid year population. The population was *moved* from the census date (8 June 2008) to 1 July 2008. This was done using the worksheet MOVEPOP from the software PASEX. The population at 1 July 2008 is presented in **Table 1.1** and in **Figure 1.2**.

Figure 1.2: Malawi census population by age groups and sex, smoothed and transfer to 1 July 2008

1.3 ASSUMPTIONS ABOUT FUTURE TRENDS

A common practice in population projections is to prepare three *hypotheses* or *scenarios* regarding the magnitude of the population. The scenarios differentiate each other mainly in the behavior of the components, especially fertility. The *middle scenario* is the one constructed with the most likely future behavior of the components. Two more scenarios can be constructed, one that recommends a more rapid population growth and another where a slower population growth is assumed. For the present projections, only one scenario is proposed. Additional hypotheses are given at the national level but only for analytical purposes.

When conducting a projection, the purpose is not to predict the population numbers for future years or decades, but to provide the size that population will have if certain assumption regarding mortality, fertility and migration trends and patterns take place in the future. Projections are not instruments to predict the future but to construct the future².

1.3.1 Mortality

The statistics on births and deaths provided by the vital registration system of Malawi are not complete and it is not possible to use them to estimate fertility or mortality levels. Thus, for the projections, the data were obtained mainly from the 2008 census. During the past 50 years demographers have developed reliable indirect methods for estimating mortality and fertility from census data, which are extensively utilized in this type of work.

The NSO has prepared Reports with estimates of mortality and fertility based on the 2008 Census³. In the case of mortality, a major issue was to establish initial life tables, which set up the initial level and age composition of mortality by males and females. These two life tables, which correspond to year 2007 are presented in **Table 2**. The construction of these life tables are described in the NSO mortality report. The level of mortality was given by under-five mortality rates (estimated with indirect methods) and the INDEPTH model life tables⁴.

After having secured a reliable and plausible life table, it is necessary to project mortality levels. The indicator utilized for this purpose is life expectancy at birth. The projection was undertaken

² Romaniuc, A. 1990. *Population projection and prediction, simulation and prospective analysis*, Population Bulletin of the United Nations No. 29, pp. 16- 31.

⁴ INDEPTH Network. 2004. *INDEPTH Model Life Tables for Sub-Saharan Africa*, Ashgate Publishing Limited, Aldershot, England.

using a logistic function with a lower asymptote of 30 years for both males and females, an upper asymptote of 70 years for males and 74 years for females and two intermediate values 40.12 years (corresponding to year 1997 and obtained from the 1998 Census) and 48.30 years (corresponding to year 2007) for males and 43.23 years (1997) to 51.40 (2007) for females. The results are presented in **Table 3**.

It is relevant to mention that in spite of the HIV pandemic, the country is experiencing⁵ a slow decline in mortality.

⁵ The country is experiencing a 11.8% prevalence of HIV. See National Statistical Office and ORC Macro . 2005 Malawi Demographic and Health Survey, 2004, Zomba, Malawi.

As the level of mortality declines, the age-sex composition is also likely to change. Therefore, it is also convenient to change the age-sex composition of mortality. Epidemiologically, as mortality experiences a decline, the age-sex composition of mortality experiences transformations. To prepare the life tables from the census, which corresponds to 2007, INDEPTH model life tables developed for Sub-Saharan Africa (cited above) were utilized. Two patterns were identified: Pattern 1, which is used in countries with HIV prevalence below 10% and Pattern 2, which assume a prevalence of AIDS of 10% or more. In the analysis of mortality, presented in the NSO mortality report, Pattern 2 was used to generate the life tables from the 2008 Census data. The prevalence of HIV in Malawi is over 10%. In the present projection, it was assumed that in 2050 the prevalence will be below 10% and, therefore, the age-sex composition of mortality will correspond to Pattern 1. The projected life expectancy at births (see **Table 1.3**) are more consistent with this prevalence and, therefore, with Pattern 1. In other words, it is assumed that mortality will continue declining and approaching a situation of a lower prevalence of AIDS⁶. The ASMR corresponding to the life expectancies at birth projected for 2050 are presented in **Table 1.4**.

⁶ Note in the projection of HIV for Malawi, the US Bureau of the Census assume a prevalence of less than 8%. See US Bureau of the Census webpage <http://www.census.gov/ipc/www/hiv/>.

Table 1.3: Projection of Life Expectancy at Birth, using a logistic trend, 2007 to 2050		
Years	Male	Female
1997	40.12	43.23
2007	48.30	51.40
2010	51.03	54.00
2015	55.45	58.18
2020	59.36	61.92
2025	62.53	65.06
2030	64.92	67.55
2035	66.62	69.43
2040	67.79	70.82
2045	68.57	71.80
2050	69.08	72.49

Asymptotes	Male	Female
Upper	70	74
Lower	30	30

Table 1.4: Projected Age Specific Mortality Rates for year 2050		
Age	Males	Female

1.3.2 Fertility

The TFR was estimated with the 2008 census data on children ever born and children born in the past 12 months. TFR from the Gompertz relational model method was recommended. The description of the estimates and logic are presented in the NSO fertility report. The schedule of ASFR corresponding to 2007 presented in **Table 1.5** was used in the projection as the initial fertility level and age pattern.

Table 1.5: Age specific fertility rates (ASFR) and total fertility rate (TFR) according to the 2008 census (corresponding to year 2007)	
Age group	ASFR
15-19	0.1932
20-24	0.3048
25-29	0.2640
30-34	0.2040
35-39	0.1392
40-44	0.0744
45-49	0.0192
TFR	5.9940

Table 1. 6: Estimated total fertility rates (TFR) for several years according to several sources		
Source	Year	TFR
PHC 1977	1976	7.6
PHC 1987	1986	7.4
DHS 1992	1989	6.7
PHC 1998	1997	6.5
DHS2000	1997	6.3
MICS	2001	6.0
DHS 2004	2005	6.3
PHC 2008	2007	6.0

PHC = Population and Housing Census
DHS = Demographic and Health Survey
MICS =Multiple Indicator Cluster Survey

In order to gain a more reliable projection of TFR, it is important to examine past fertility trends. **Table 1.6** shows several estimates of TFR for different years and different sources. The information was also obtained from the fertility report mentioned above.

Figure 1.3 shows the respective scatter graph and the best fit function, which is a linear trend. This was undertaken using the EXCEL *trend line* command. The best fitting curve was a linear equation. Using the equation corresponding to the trend TFR was projected up to year 2050 (see **Table 1.7**). A logistic function was also used to project the TFR, which is also presented in **Table 1.7**. Considering that fertility is experiencing a slow decline in Malawi, the linear function was preferred. It was judged that the logistic function projects a decline that is too rapid for Malawi taking into consideration the recent trend. This is especially the case for the near future.

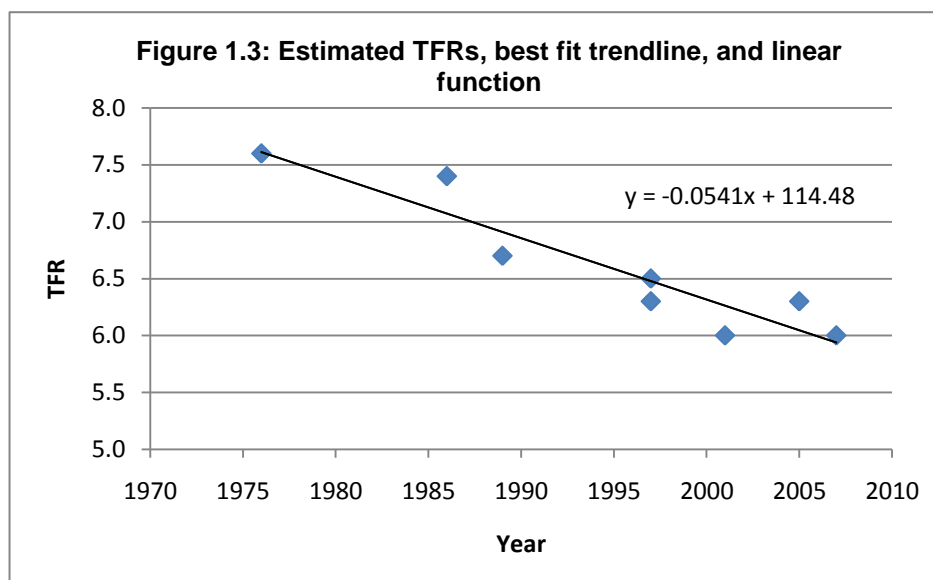

Table 1.7: Projected total fertility rates according to a Linear and a Logistic functions

Year	Projected TFR	
	Linear	Logistic
2007	5.94	5.79
2010	5.78	5.54
2015	5.50	5.12
2020	5.23	4.72
2025	4.96	4.37
2030	4.69	4.06
2035	4.42	3.80
2040	4.15	3.60
2045	3.88	3.45
2050	3.61	3.33

As fertility experiences a decline, the age composition is also likely to change. **Table 1.8** shows the ASFR corresponding to the TFR projected for 2050. It was estimated using the United Nations fertility models. The Sub-Saharan pattern for TFR = 3.6 was selected. Operationally, in the RUP program, the indicator of fertility for year 2050 will be a schedule of ASFR and not a measure of TFR.

Table 1.8: Age Specific Fertility Rates (ASFR) estimates for year 2050 according to the Sub-Saharan United Nations fertility structure model

Age groups	TFR=3	TFR=4	TFR=3.6	ASFR 2050
15-19	0.140	0.149	0.1454	0.1050
20-24	0.311	0.259	0.2798	0.2020
25-29	0.247	0.221	0.2314	0.1671
30-34	0.166	0.171	0.1690	0.1220
35-39	0.092	0.117	0.1070	0.0773
40-44	0.036	0.064	0.0528	0.0381
45-49	0.006	0.018	0.0132	0.0095
Sum	1.00	1.00	1.00	0.72
TFR				3.60

1.3.3 International Migration

It was assumed that international migration will not play a major role during the projection period. In fact, using the census question of members of the household that left Malawi during the last 10 years as well as the questions of previous place of residence and years living in the current place of residence, it was estimated that the average number of immigrants during the past 5 years was 3,618 and the number of emigrants was 16,855. Therefore the net international migration was -13,237. The number corresponds to a contribution of only -3.3% to the population change between 2007 and 2008. In the projection, it is not affirmed that international migration does not take place in Malawi, but that it is not sufficient to make a relevant contribution to the population size and demographic dynamics of the country during the future if the recent levels continue. It is possible that in the future, as a result of population pressures caused by the high fertility rates prevailing in the country, it increases substantially. However, evidence on this regard is not available.

A summary of the projection is presented in **Table 1.9** while the complete results by age and sex are shown in **Appendix A**.

Table 1.9: Malawi: Population projection and selected demographic indicators

Year	Total	Absolute annual increase	Rate of growth (exponential)	Births	CBR	Deaths	CDR	LIFE EXPECTANCY			IMR (PER 1000 LIVE BIRTHS)			TFR	Natural increase	Sex ratio	Median age	Percentage under 15 years of age	Total dependency ratio	Child dependency ratio	Aged dependency ratio	Percentage population in working age	Percentage of women in reproductive age	Ageing index	Caretaker ratio

CHAPTER 2

ANALYSIS OF NATIONAL PROJECTION RESULTS

2.1 INTRODUCTION

The purpose of projection is not to predict the population numbers for future years or decades, but to provide the size that population will have if the outlined assumptions regarding mortality and fertility trends and patterns take place in the future.

2.2 POPULATION GROWTH

Information from **Table 2.1** shows that Malawi will continue to experience a rapid rate of growth in spite of the assumption on declining fertility and that mortality is not experiencing a substantial decline. This is very clear by looking at the absolute annual population increase. At present, population increase is less than half a million people per year, but in 2015 this increase will reach half a million, by year 2028 three-quarters of a million and by year 2044 the population will be expanding at one million per year. This substantial growth is also indicated clearly by the annual rate of growth. Only in year 2033, will it be less than 3% per year and by the end of the projection period it will be a little less than 2.5%. Note also that by year 2033 the annual number of birth will be more than one million. There is no consensus regarding the impact of rapid and substantial population growth on economic and social development.

2.3 POPULATION MOMENTUM

It was assumed that fertility will decline and will continue doing so during the entire projection period. In spite of this assumption for the future, the population will continue rising. It is true that the pace of population growth will decline during the next four decades, but one might expect a more significant decline considering the assumed fall in fertility. The main reason for this apparent limited influence of fertility on population growth is the *population momentum* that the population of Malawi is experiencing. Past and recent high fertility rates give the potential for a rapid and substantial population growth in spite of fertility decline. The column on the percentage of women in reproductive age (15-49 years) gives a clue to understand this concept. In fact, although fertility is assumed to fall the number of women giving births will be increasing. Note that the number of births rises during the whole projection period. The number of women in reproductive age is expected to increase from approximately 3 million in 2008 to 6

million in 2030 and to 11 million in 2050. In spite of a decline in the average number of children that women will have, the number of births will continue to increase.

2.4 AGE STRUCTURE

Not only is the population size an important issue to be considered in planning and policy making. The age structure of the population is also important. In this projection it is assumed that fertility is declining. According to the 2008 census TFR was 6.0 children per woman in 2007 and it is assumed that it will decline to 4.7 in 2030 and 3.6 in 2050. This proposed decline is slow and the levels of fertility, although declining, will continue being comparatively high. However, this decline will certainly affect the age composition of the population. **Table 2.1** shows several indicators that describe the possible future characteristics of age structure. The first one is the median age. It is the age that divides a population into two numerically equal groups; that is, half of the people are younger than this age and half are older. At present it is almost 17 years, indicating a very young population, but it will experience a slow increase reaching 21 years in 2050. Another important indicator is the percentage of the population under 15 years of age. At present it is around 46% and it will decrease to approximately 38% in 2050. These trends indicate a transition from a very young to a more mature population indicating a slow process of demographic ageing. It is important to clarify that, in demography, an ageing populations does not mean that old-age people will predominate in the population or will reach a very high percentage; thus, the proportion of children is declining, the proportion of middle age people will increase substantially and the elderly will experience an increase. These are precisely the changes that are taking place in Malawi. As indicated, the proportion of young population is declining while the proportion of people in working age is experiencing a substantial increase in the-population 15 to 64 years. From 2008 to 2050 it will increase from 50% to 58%. It is also interesting to examine the Child Dependency Ratio, which is the ratio between the population 0-14 years and the population 15-64 years. This is a crude indicator of the young population that *depends economically* on the working age population. According to **Table 2.1** it will decline from 91 to 65 *young dependents per worker* between 2008 and 2050. The proportion of the old age population will experience a moderate increase. The old age dependency ratio (65+ over 15-64 years population), the ageing index (65+ over 0-14 years population) and the caretaker ratio (80+ population over 50-64 years female population) experience fluctuations but on the overall they indicates an increase in the proportion of the elderly.

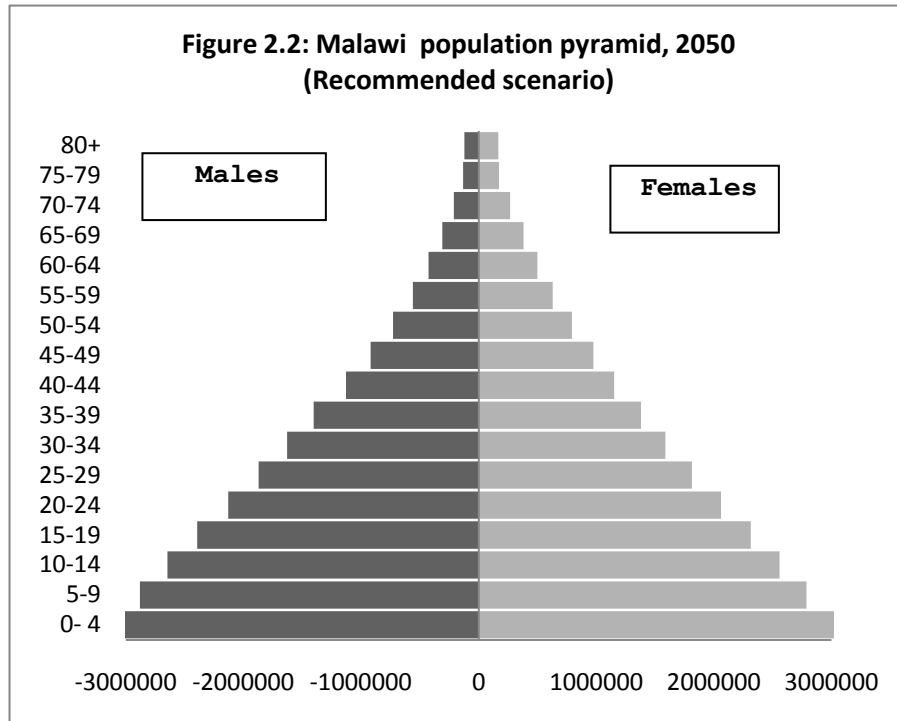

It is important to mention here that the expected changes in the age structure of Malawi, as a result of fertility decline, if it occurs, suggests a potential *demographic bonus*; that is, a population composition that positively affects socioeconomic development. Nevertheless, considering that fertility decline will be slow and not very substantial, this demographic bonus may not occur.

2.5 POPULATION PYRAMID

The clearest way to show the structure of a population is by a population pyramid. Figures 2.1 to 2.2 show the population pyramids resulting from the recommended scenario for each quinquenium between years 2010 and 2050. The pyramids reveal clearly the expansion of the population given that the area of the pyramid represents total numbers. Notice that during the projection period, the pyramids maintain their triangular shape; they inflate substantially but their profile remains similar. The reasons are, first, the high level of fertility at the beginning of the projection period and second, the comparatively slow assumed fertility rate decline.

Figure 2.1: Malawi population pyramid, 2008 (Recommended scenario)

2.6 ALTERNATE FERTILITY HYPOTHESIS

Under which conditions would Malawi exhibit an age structure favorable for development? **Table 2.2** shows a summary of the results of the present projection (recommended or most likely hypothesis) and also of two alternative projections calculated under two different fertility hypotheses. In the first alternative scenario, fertility is assumed to decline linearly toward a TFR of 2.0 children per woman in year 2050⁷. This is the *rapid fertility decline* hypothesis (RFD). In the second scenario, the assumption is that TFR will decline linearly up to a 2.5 children per woman in 2050 and then experience a moderate decline and reach 1.8 children in 2050. This is the *very rapid fertility decline* (VRFD) hypothesis. Regarding the population growth the differences among the three scenarios are notable. The absolute annual increase in the RFD

⁷ A TFR of 2 children per woman is a little below replacement level. This concept refers to the average number of children sufficient to replace both parents in the population. The replacement level is usually over 2 children because not all children survive their childbearing years and, therefore, will not replace their parents. In developed countries a TFR of 2.1 children per woman is considered as replacement level. In developing countries, with high mortality levels a TFR higher than 2.1 is considered as a replacement level.

scenario by the end of the projection period will be about half a million as compared with one million in the recommended scenario.

According to the VRFD hypothesis, the average annual increase by 2050 will be a little more than a quarter of a million. It is also interesting to compare the annual number of births among the three scenarios. The differences in population growth shown in **Table 2.1** are as important as the variations among the age structures. The proportion of the young age population is much smaller in the RFD and VRFD than in the recommended hypothesis as indicated by the percentage of the population under 15 years and the child dependency ratio. Note that in the VRFD the percentage of the population under 15 years in 2050 would be only 22.7%. On the other hand, the working age population experiences a substantial increase in both alternative hypotheses. Note that the increase in this percentage is caused mainly by the decline in the size of the young-age groups. The aged population will also experience an increase and it will be caused exclusively by the decline in the proportion of young people. This absolute increase will be caused by the ageing of the large population cohorts born during recent decades⁸.

⁸ Note that the caretaker ratio is the same in the three projections. This is because the age groups included in this ratio are not affected by fertility during the projection period, which is the component that differentiates the three hypotheses (population 85 years and older and female population 50 to 64).

Table 2.1 : Malawi: Three population projection and selected demographic indicators under different assumptions about fertility

CHAPTER 3: POPULATION PROJECTIONS AT THE DISTRICT LEVEL

3.1 INTRODUCTION

Considering the larger uncertainty of small area projections, the projection period at the district level was from year 2008 to year 2030 and not up to year 2050 as it was in the national projection.

Malawi is administratively divided into 28 districts and 4 cities. Tables in appendix 1 show the population by age and sex of the 32 administrative units. These populations have been conciliated with the national base population presented in the third panel of **Table 1.1** making them comparable to the 1 July 2008. The sum of these sub-populations is equal to the national population (by age groups and sex).

3.2 MORTALITY

The initial mortality level and pattern was estimated from the 2008 census following the same approach used in the national estimates that used early-age mortality and the INDEPTH model life table (Pattern 2). The results are presented in appendix 2.

Mortality was not projected by using past mortality patterns. Changes in boundaries and limited availability of data made other options preferable. In fact, it was assumed that in each unit, life expectancy at birth will decline at the same pace as in the country. The result is presented also in the same appendix 2. As indicated earlier, at the national level, it was assumed that life expectancy at birth will increase according to a logistic trend.

3.3 FERTILITY

Considering that the observation of past trend were quite difficult, fertility was projected using the same approach as mortality, It was assumed that in all the districts, fertility will decline at the same pace as that at national level. The declining trend in this case is linear. The resulting TFRs are presented in **Table 3.1**. In the same table, ASFRs are presented at both the initial (2007) and the final (2030). As in the national projection, the final ASFRs were calculated with the United Nations fertility models. The Sub-Saharan pattern for the respective TFRs was selected.

The hypothesis of assuming that mortality and fertility will decline at the same pace at at national level in all the districts may not result convincing to some readers. However, considering the high level of mortality and fertility, and the relatively short length of the projection period, it was assumed that the observed differences will continue in the future.

3.4 INTERNAL MIGRATION

Regarding internal migration, it was measured using the questions on previous residence and duration of stay in the present place of residence. The number of in-migrants and out-migrants during the five years prior to the census by age groups and sex was tabulated for each district. Net migration was calculated and the input used for the initial projection year was the average net migration during the five years previous to the census. The average number of net migrants (2004-08) by sex and age groups was used. Note that annual number of migrants was used and not migration rates as it is easier to process absolute numbers in RUP software. Also note that *number of net migrants* or *net migrant* is an abstract idea. It does not correspond to persons, but to the result of an arithmetic operation. Some demographers feel uncomfortable working with such an intangible concept and, in fact, *absolute net migrant* is not an appropriate concept for migration analysis. However, it is quite operational for population projections.

It was assumed that the number of net migrants by age groups and sex will double during the projection period. This trend is likely to occur because of the high rates of population growth prevailing in the country. According to the national projection, it is expected that population will approximately double its size between 2008 and 2030. For this reason, it is plausible that migration will also double its magnitude during the projection period considering the rapid population growth and the strong population pressures that some areas will experience in the future. In addition, the level of geographical mobility in the country is quite low as indicated by the numbers of net migrants. This is actually the strongest argument in favor of an increase in the number of net migrants in the future.

3.5 ANALYSIS OF DISTRICT LEVEL POPULATION PROJECTIONS

Using the previously described projected level and trends in mortality, fertility and net migration, the population of each district was projected. **Table 3.3** shows a summary of the projection by districts and several demographic indicators. The projection by age groups and sex is presented in **Appendix B**. Note that the sum of the age-sex projected district populations correspond to the national age-sex projected population.

3.5.1 Population Distribution

One of the important issues in demographic analysis is to examine whether or not the assumed demographic dynamic will result in a redistribution of the population and how significant this will be. This information is in the second column of the panels representing each district in Table 13 (% of total). In spite of substantial differences in the rate of growth, a redistribution of the population from the beginning of the present decade to the end of the next will not be substantial. The most substantial change will take place in Lilongwe City where the population that in 2008 represented 5.2% of the country's population, will correspond to 8.4% in 2030. In the other districts no major changes will be observed. The main reasons of these feature is the limited time span of the projection period and the fact that, at present, the districts do not exhibit major population concentrations. For example, no district contains more than 10% of the population.

3.5.2 Population Growth

There are, however, other relevant aspects that are important to mention. One of them is that, in spite of a declining fertility and sometimes relatively heavy out-migration all districts exhibit positive growth rates and in all cases the rates are larger than 1% per annum. The only exception is Likoma, but the district has a very small population and it has very high out migrants rate as presented in the NSO migration report . Even more important is the high rate of growth in some districts. For example, Lilongwe City will experience a rate of more than 4% at the end of the projection period. In absolute terms, its population will increase from 678,215 in 2008 to 2,200,362 in 2030, that is, its population will increase by more than three times in 22 years. Other examples of substantial population growth are Blantyre City and Zomba City. The population in the former will increase from about six hundred to one and half million and the latter from one hundred thousand to three hundred thousand during the projection period. This increase is the result of the expected limited fertility decline, the *population momentum* and substantial in-migration. The main issue here is whether or not the urban infrastructure will be able to support in a sustainable way such a rapid population increase and whether or not the urban economy will be able to absorb the respective increase in the supply of labor. This type of scenario does not seem to be favorable to improving the socio-economic situation of the country.
